## 2000w pmpo equivale a quantos rms lu

Pmpo a rms.

Audio is one of those worlds where unfortunately all types of Hokey information is simply composed to seem impressive on the package. Reactions: Fusseltier You can't really convert the Peak Power Music Power score (AHEM) to RMS. You can hear the speakers advertised as "150 Watt 6 x 9s" or "100 watts 6 x 9s" and you can instantly think that the "150 watts 6 x 9s" are better and will play stronger than the loudspeakers classified at 100 watts. How then does it also apply to Powertools, 1KW Drill Yeh ?? So the peak of musical power is meaningless. Actually, the pump is not rubbish !!!!!!!!!!! Is it so: how did that post contribute to anything? PMPO is not much more than a marketing ploy, there are no real information contained in the number given, or how it was obtained. Not only a possibility, only the garbage uses the pampo ratings. You would be lucky to have 300 watts of heat from them if they were connected directly to the wall, lol. If it is evaluated in the pump, there is a good possibility that both trash. Bottom Line, pay attention to power evaluations on speakers. PMPO is a completely garbage assessment, which you cannot translate into any sensible assessment, and no decent producer ever use it!. RMS is the correct value to be used and mentioned on which frequency interval. Looking at the motivez, maybe 400 watts, probably mention the power with the engine armor in the locked position, could draw 1 kW, it will only take a very short time before getting into smoke and sparks. Those tiny plastic speakers Small speakers powered by batteries or a tiny wall adapter, with an assessment of 300 pumps. Pic Programmer Software and Pic Tutorials at: in reality, PMPO is not !!!!!!!!!!! It is so: the degree of power of the speaker (in general) tells you how much A.C. Power can be dissipated into the speaker vocal reel without damaging the speaker. While the Peak Power is a legitimate way to evaluate speakers speakers As long as the manufacturer tells you that power power is watts peak), can be deceptive. Honest energy evaluations: the most honest way to evaluate a speaker is to vote as continuous RMS Watts (ex: 150 Watts continuous power RMS). We still suffer the equivalent of the pump mentality in electric utensils. Quite right, the pump has no resemblance to an appropriate specification - I saw the pump values range from 10 times RMS to over 100 times RMS. Divide the pump for the number of speaker channels then divide the result for 2 and you could approach the RMS output or you can't. Peak vs RMS: You know the peak is 2 \* RMS power. This would only convert the peak in RMS, PMPO would need to divide from a higher number, unknown, different for each value!. Most self audio speakers (except some subwoofers) are valued in maximum power or musical power. Peak vs RMS: You know the peak is 2 \* RMS power. You can't really convert the peak power music score (AHEM) to RMS. However, this can vary a lot as some RMS sizes are taken only at 1 kHz Sine Wave and do not quote distortions. Pic Programmer Software and Pic Tutorials at: Musical power ratings are high because the measurement is only for a moment, before the supply voltage decreases due to being loaded. The questions asked can be discussed in open forums, so we can all learn from it or participate in a solution. Mine is 400W + 400W RMS in 4 ohms or 800W with 8 ohms, and includes an eight-channel mixer with two digital effects channels - only 12 kg weighs - because it is class D and use an SMP. Actually, the pump is not rubbish !!!!!!!!!!! It is so: the degree of power of the speaker (in general) tells you how much A.C. Power can be dissipated in the vocal reel 069 069 a itacifissalc icitamrofni itnalrapotla id tes nu ah aim alled ocima nu .OPMP elituni "À emoc id oipmese emoc reitlessuF :inoizaeR .etnalrapotla'l eraiggennad aznes rewop rieht ni tsenoh naht ssel era srerutcafunam emos taht gniwonK .detareggaxe NETFO era sgnitar rekaeps taht si ezilaer dluohs uoy gniht tsrif eHT .deniur nempiuqe eht fo eulav eht of lanoitroporp ylterid si ecneirepxE .srekaeps no sgnitar rewop fo eraweb .enil mottoB :tnemetats eht ekam uoy yllautnevE !hsot dlo fo tol a tahW .emoR of teg of syaw erom era erehT À@À dnomyaR sreehC .eb nac rekaeps a duol woh fo erutcip retteb a uoy evig ytivitisnes dna gnildnah rewop fo noitanibmoc ehT .rerutcafunam hcae fo noitnevni A SI DNA, KNUJ = OPMP EROFEREHT, LLA SKNAHT KU.OC.GORPCIPNIW.WWW //: pTTH: Ta Slairotut Cip DNA, Erwtfos Remmargorp Cip .lon Yam UOY RO TUGUO SMR EHT EHT EDIVID neht siennahc rekaeps fo rebmun eht yb OPMP edivid .scipot lacirteele tuoba segassem etavirp em tnes t'nod esaelP .elpoep esufnoc of dengised mret yrtsudni rehtona si "rewop cisum" taht dda dluow I 75MR of OPMP staw trevnoc woh wonk enoemos .IH . Basically if something is classified in PMPO it's just a bunch of junk, no honest manufacturer would cite using it!. If it's rated in PMPO, there's a good chance it's junk. Its amazing to see a small router or vacuum cleaner for woodworking rated at 5 HP! They have to measure the HP of those engines that have brushes when they are stalled and start smoking. Then you should ask if the rating is in RMS or watts of peak and are the ratings of the speakers for instantaneous or continuous power. Although there are two speakers from different manufacturers that have the same rated power, one manufacturer can be more cautious than the other. The frequency and amount of distortion are not specified so it could be anything. then the transformer 9V 300 mA so it goes figure. Although it is not a high end amplifier, the amplifier I use is rated at 440 watts RMS on a 4 ohm (2 channels) load and weighs as much as 55 à 60 pounds. Knowing that some manufacturers are not honest in their power ratings, that still seems to be the general opinion of this thread. I used the RMS at a constant frequency of 1 kHz from my memory. Well my 240 watt pmpo turned out to be 3 watts each so 6 watts in total but those weren't more than 1-2 watts per channel, judging by the pathetic IC heatsink. I think this whole pmpo thing only lasted a few years because now they're all back to RMS but don't take their word for it or my 10W woofer on my 2.1 system is actually 8W and I don't wonder what the speakers really are, but it's true that 10W would be too noisy. Up to 5 watts per channel. Software for PIC programmers and PIC tutorials ku.oc.gorpcipniw.www//pTH ku.oc.gorpcipniw.www//pTH Fusseltier as an example of how PMPO is unusable, a friend of mine has a set of computer speakers rated at 960 watt PMPO. Think about it this way... 2x40w rms from an amp like that is very loud (although the volume depends on the speakers, mine are quite sensitive). I wouldn't dare put it past the middle, the doors start to roll out and things. The peak is simply doubling the real power. Most of that number comes from the massive transformers in it. If a speaker is rated to handle 150 Watts 'Music Power', it could mean that the speaker will only take short bursts of power approaching 150 watts rms. Its whole system takes up less space, the woofer in my speakers rated for 400 watt rms. The more established speaker would be more likely to handle its rated power. Only some speakers (usually higher quality speakers) are rated in RMS Watts. Jimb PS How should we pronounce your name? PMPO PMPO = Junk is a correct statement, is a correct statement, has been used by advertising agencies to promote the so-called Hi-powered audio equipment which is in fact poor and provides only a fraction of the value of the quoted audio output. All I see in more power than the Necessario is better quality at a normal power level Yes, PMPO seems to have dissolved a bit, and manufacturers now cite RMS now quite frequently. frequently.
